# IAM MFA HAND'S ON

There are two ways from which you can secure your account .

1st one is password policy :-

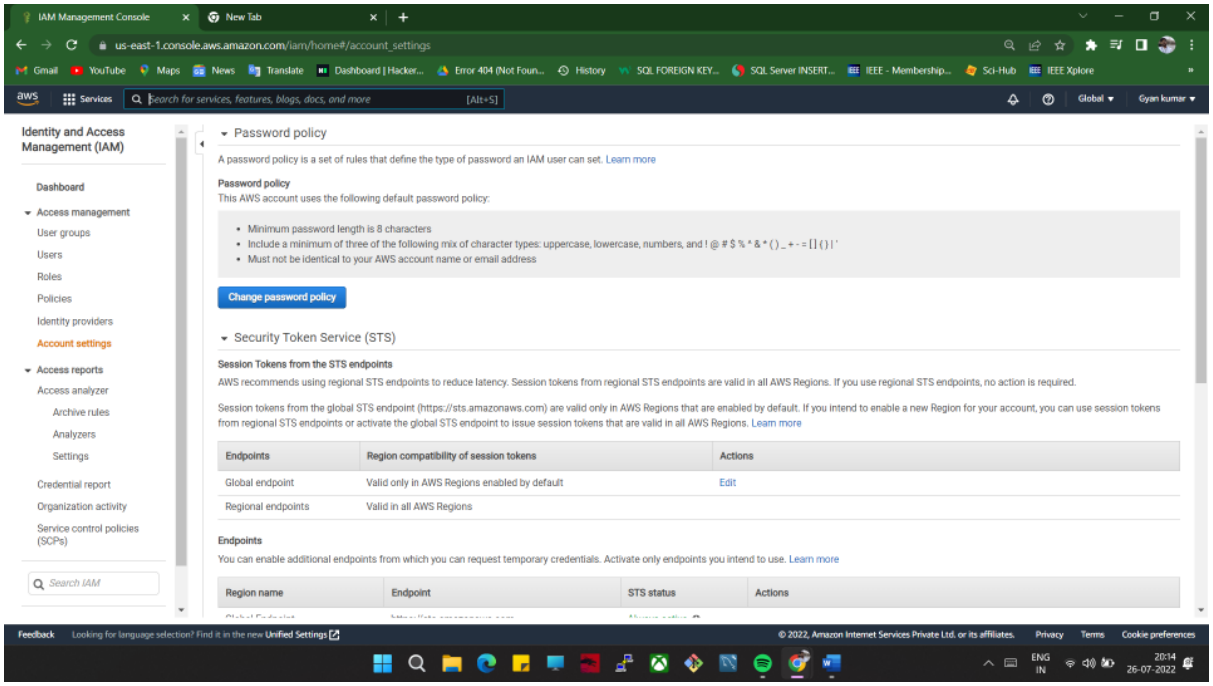
## IAM – Password Policy

- Strong passwords = higher security for your account
- In AWS, you can setup a password policy:
  - Set a minimum password length
  - Require specific character types:
    - including uppercase letters
    - lowercase letters
    - numbers
    - non-alphanumeric characters
  - Allow all IAM users to change their own passwords
  - Require users to change their password after some time (password expiration)
  - Prevent password re-use

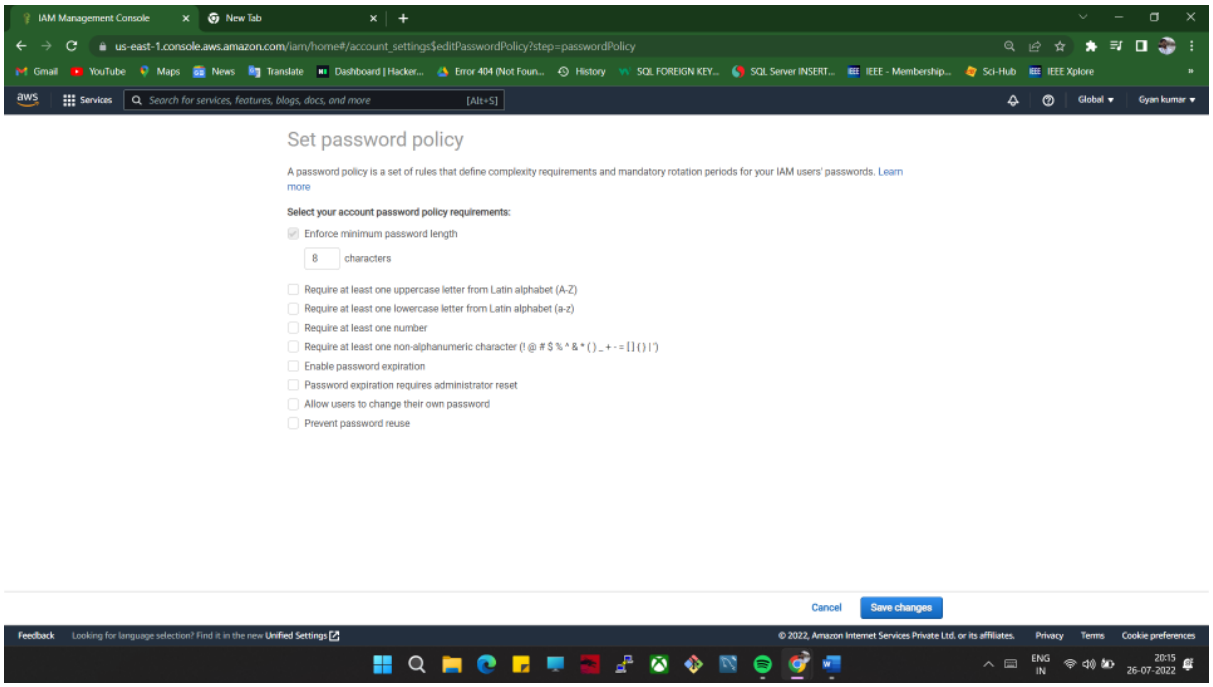
But it is not the sufficient way to secure your account ,you can use MFA for more security of your account .

- MFA = password *you know* + security device *you own*

Step 1:- Go to account setting



Step 2:- Click on change password policy :-



Step 3:- you can change password policy and secure your account .

Now for MFA we don't need to do if we will do that it will enhance our security policy .
